The state of all streams and their requests and responses VARIABLE requestStream, requests, responseStream, responses

```
Message related variables message Vars \triangleq \langle requests, responses \rangle Stream related variables stream Vars \triangleq \langle requestStream, responseStream \rangle
```

Discards the request at the head of the queue for node 'n'

This section models the messaging between controller nodes and the device. Messaging is modelled on TCP, providing strict ordering between controller and device via sequences. The 'requests' sequence represents the messages from controller to device for each node, and the 'responses' sequence represents the messages from device to each node. Requests and responses are always received from the head of the queue and are never duplicated or reordered.

```
Returns a sequence with the head removed Pop(q) \triangleq SubSeq(q, 2, Len(q))

Sends request 'm' on the stream for node 'n' SendRequest(n, m) \triangleq requests' = [requests \ EXCEPT \ ![n] = Append(requests[n], m)]

Indicates whether a request of type 't' is at the head of the queue for node 'n' HasRequest(n, t) \triangleq Len(requests[n]) > 0 \land requests[n][1].type = t

Returns the next request in the queue for node 'n' NextRequest(n) \triangleq requests[n][1]
```

 $DiscardRequest(n) \stackrel{\triangle}{=} requests' = [requests \ EXCEPT \ ![n] = Pop(requests[n])]$ 

```
Sends response 'm' on the stream for node 'n' SendResponse(n, m) \triangleq responses' = [responses \ \ \texttt{EXCEPT} \ ![n] = Append(responses[n], m)]
Indicates whether a response of type 't' is at the head of the queue for node 'n' HasResponse(n, t) \triangleq Len(responses[n]) > 0 \land responses[n][1].type = t
Returns the next response in the queue for node 'n' NextResponse(n) \stackrel{\Delta}{=} responses[n][1]
Discards the response at the head of the queue for node 'n' DiscardResponse(n) \stackrel{\triangle}{=} responses' = [responses \ \text{EXCEPT} \ ![n] = Pop(responses[n])]
```
